

Do you feel a draft?

***Which came
first the
chicken or
the seal?***

It's a fact - energy costs are high and only getting higher. Poor seals on just about anything will add to increased energy consumption. Such was the case for Ed Stovall - Hatchery Manager in Mount Joy, PA. Ed needed new door seals on incubators and hatchers and was looking for a product that would comply to the irregular surfaces of the existing equipment and form a tight seal. Any new gasket would need to have excellent chemical and abrasion resistance and offer long service life.

“The old gasket tape was just not sealing or holding up well. After each washdown the gasket would fall off and require a new seal to be installed. This was an expense that was repeated constantly”.

FOAM GASKET ON DOORS BEFORE

Problem solved! To meet Ed's performance criteria Industrial Energy Products, Inc. developed a tadpole gasket utilizing Silicone impregnated Glastemp fabric over a closed cell neoprene sponge core. The new Glastemp tadpole seals proved to seal the irregular surfaces and have the durability to with stand repeated washings. A door seal that was purchased and installed weekly can now be replaced with a Glastemp seal that can provide years of efficient service.

GLASTEMP TADPOLE GASKET ON DOORS AFTER

**SINGE BULB
STYLE**

**DOUBLE BULB
STYLE**

**SINGLE BULB INSTALLED
ON HATCHER DOOR**
